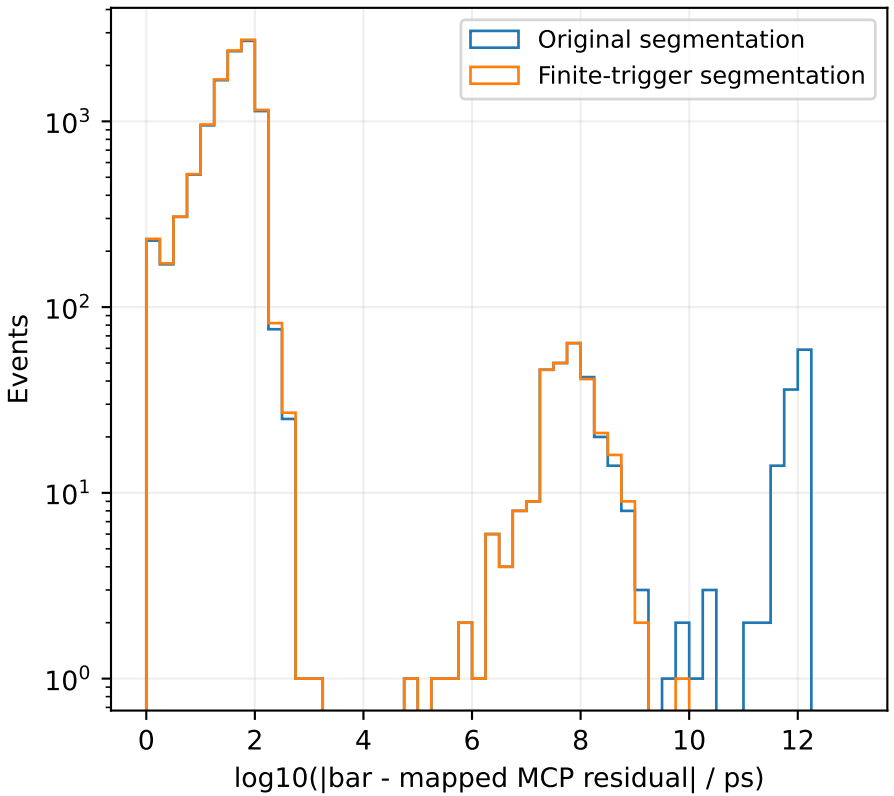
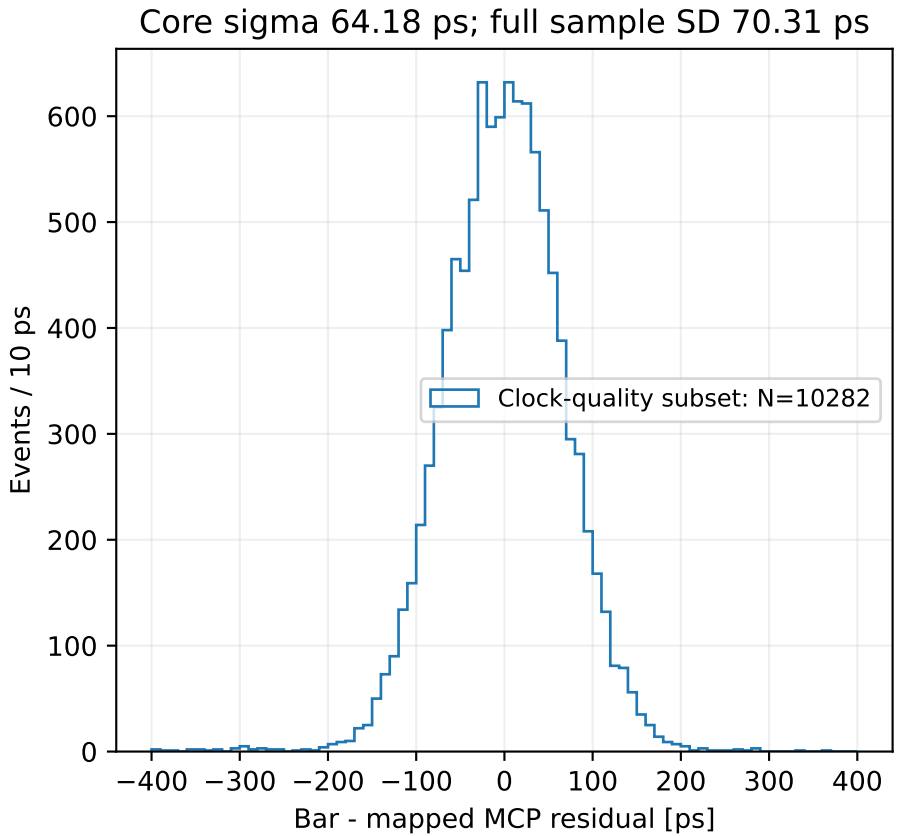
CMS Preliminary Phase 2

Clock validation: failures hidden by a core-only plot

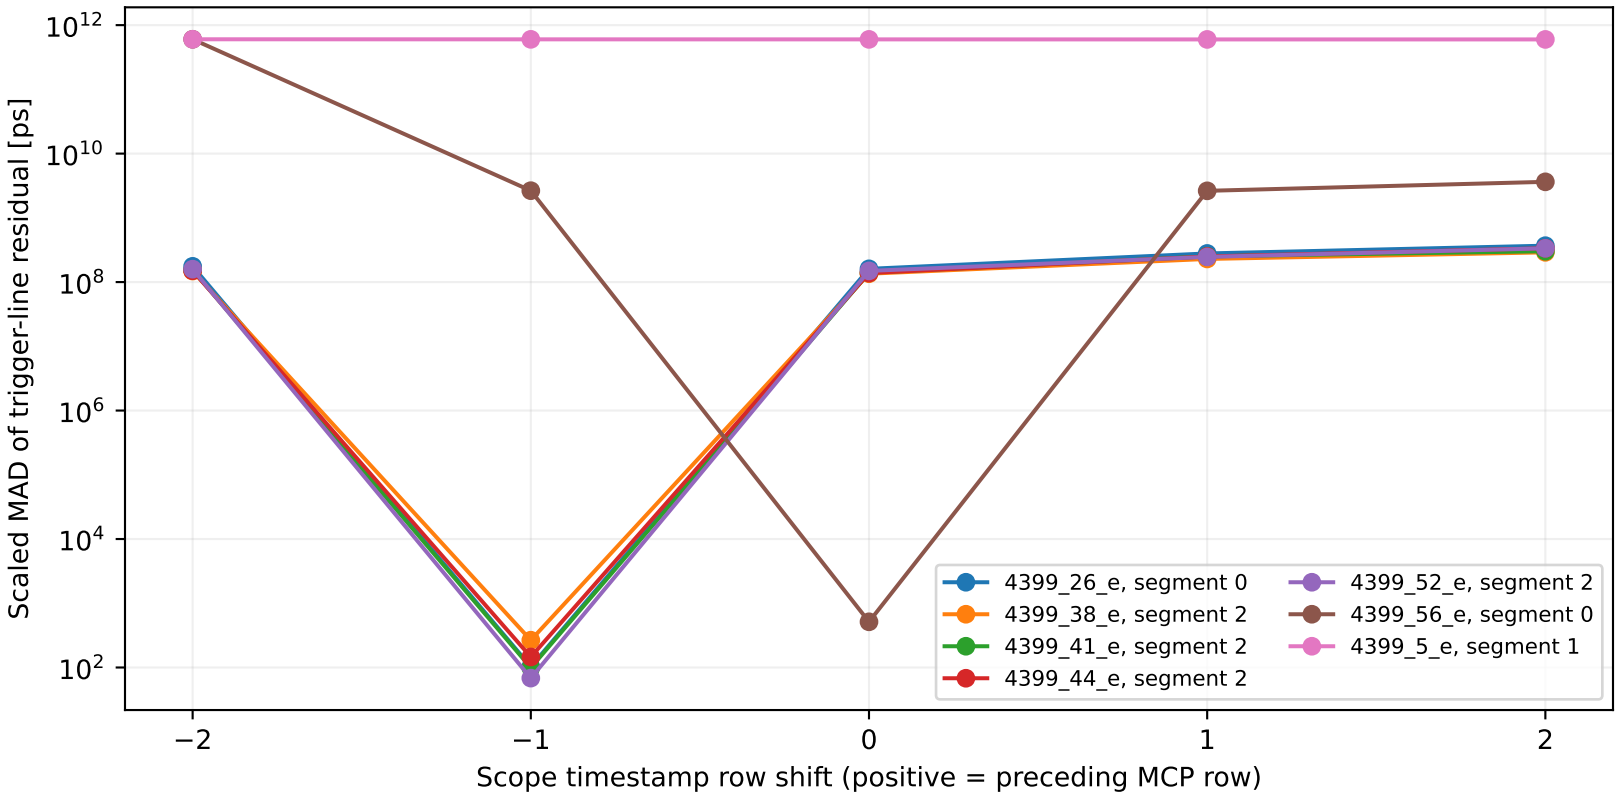




Local diagnostic only: segment finite scope triggers across NaN gaps, then reject entire clock groups with line-residual scaled MAD >= 1 microsecond. This uses clock signals, not the SiPM timing residual.
Frozen walk curves are unchanged. No production fix or final resolution claim is made.

CMS Preliminary Phase 2

Diagnostic of a possible one-event matching offset



Row shifts are a diagnostic, not an applied correction. A large improvement at a one-row shift warrants an audit of event association upstream of clock calibration. This does not establish a safe remapping rule.
